

# Universal Test & Treat trials: What they tell us about HIV Epidemic Control in 2019

**What do the Universal HIV test and treat (UTT) trials tell us about HIV Epidemic Control in 2019?**

# “First Generation” Universal Test and Treat Trials

- › Randomized, **population-based combination intervention studies** integrating **HIV testing, prevention and treatment**
- › Conducted in Southern and Eastern Africa across a range of HIV prevalence
- › Conducted during global transitions to “treat all”, “differentiated care,” and rapid ART start
- › Pre-dated PrEP roll-out
- › Short follow-up ~3 years
- › Used measurement approaches that impacted outcomes (HIV diagnosis, viral suppression, and possibly behavior) in intervention and control arms

# UTT Trial Designs

Trial	BCPP/Ya Tsie		PopART			SEARCH		TasP	
<b>Country</b>	Botswana		South Africa / Zambia			Kenya / Uganda		South Africa	
<b>Prevalence</b>	29%		22%			4-19%		30%

# Study Interventions: Universal HIV testing

**Goal: Ensure all PLHIV are HIV tested (or retested) and offered rapid ART start**

1. Persons not previously HIV diagnosed (and newly-infected, as soon as possible)
2. Persons already diagnosed with HIV but who have not started ART or who have fallen out of care

**Approach: “Out of facility” (increase access, reduce stigma)**

Community partnerships and mobilization followed by

1. Home testing & mobile testing (BCPP, PopART, TasP)
2. Multi-disease health fairs followed by home testing for non-participants (SEARCH)
3. Demand generation strategies for men and youth
4. Repeated regularly (6 monthly or yearly)

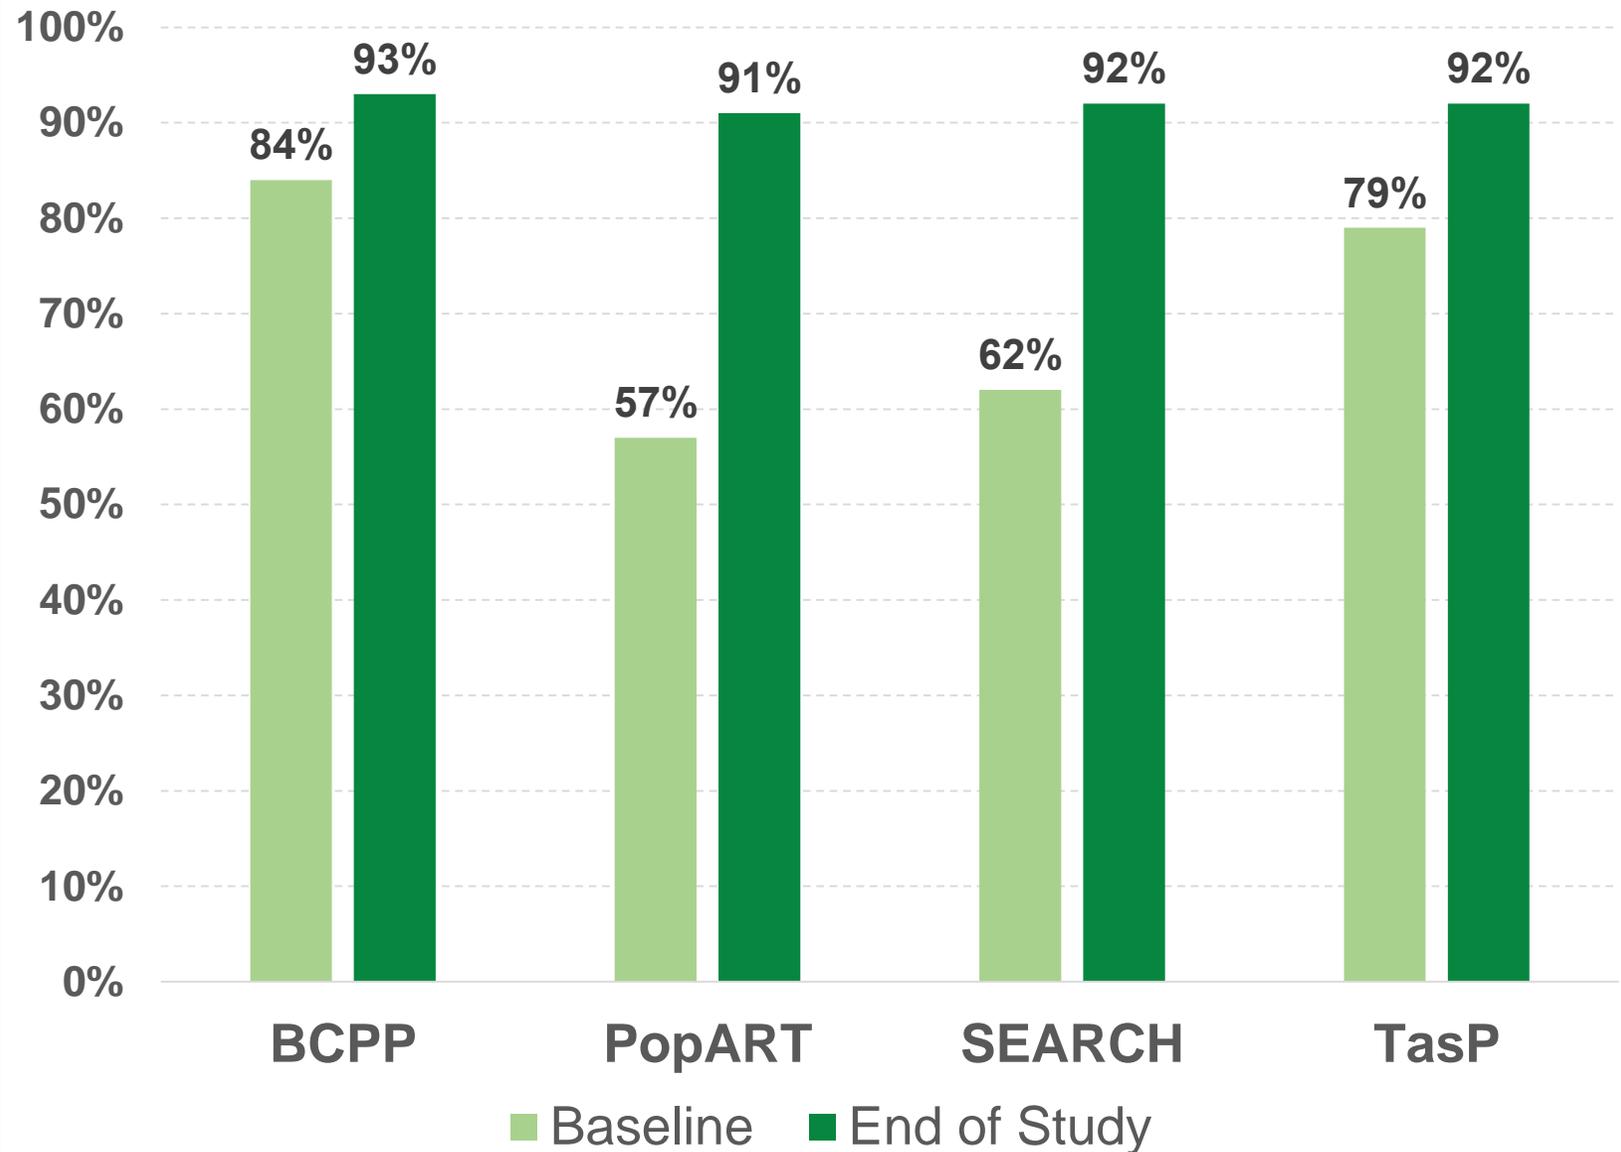

# Study Interventions: Linkage & ART start

- › **Goal: Ensure all PLHIV out of care are offered rapid linkage and ART start upon HIV testing**
- › **Approach: Patient-centered interventions to bridge out-of-facility testing to clinic with ongoing retention support**
  1. Health workers facilitated linkage from home or health fair testing
  2. Rapid ART start (same-day with starter packs or 1<sup>st</sup> clinic visit)
  3. Supportive (not punitive) clinic environment, text appointment reminders with tracking, men & youth "friendly, multi-disease (SEARCH)

# 1<sup>st</sup> 90: Known HIV Status / All HIV+

With UTT, >90% of all PLHIV were tested (1<sup>st</sup> 90)

- › Achieved within 1-2 of years in some studies
- › In a variety settings-urban and remote rural

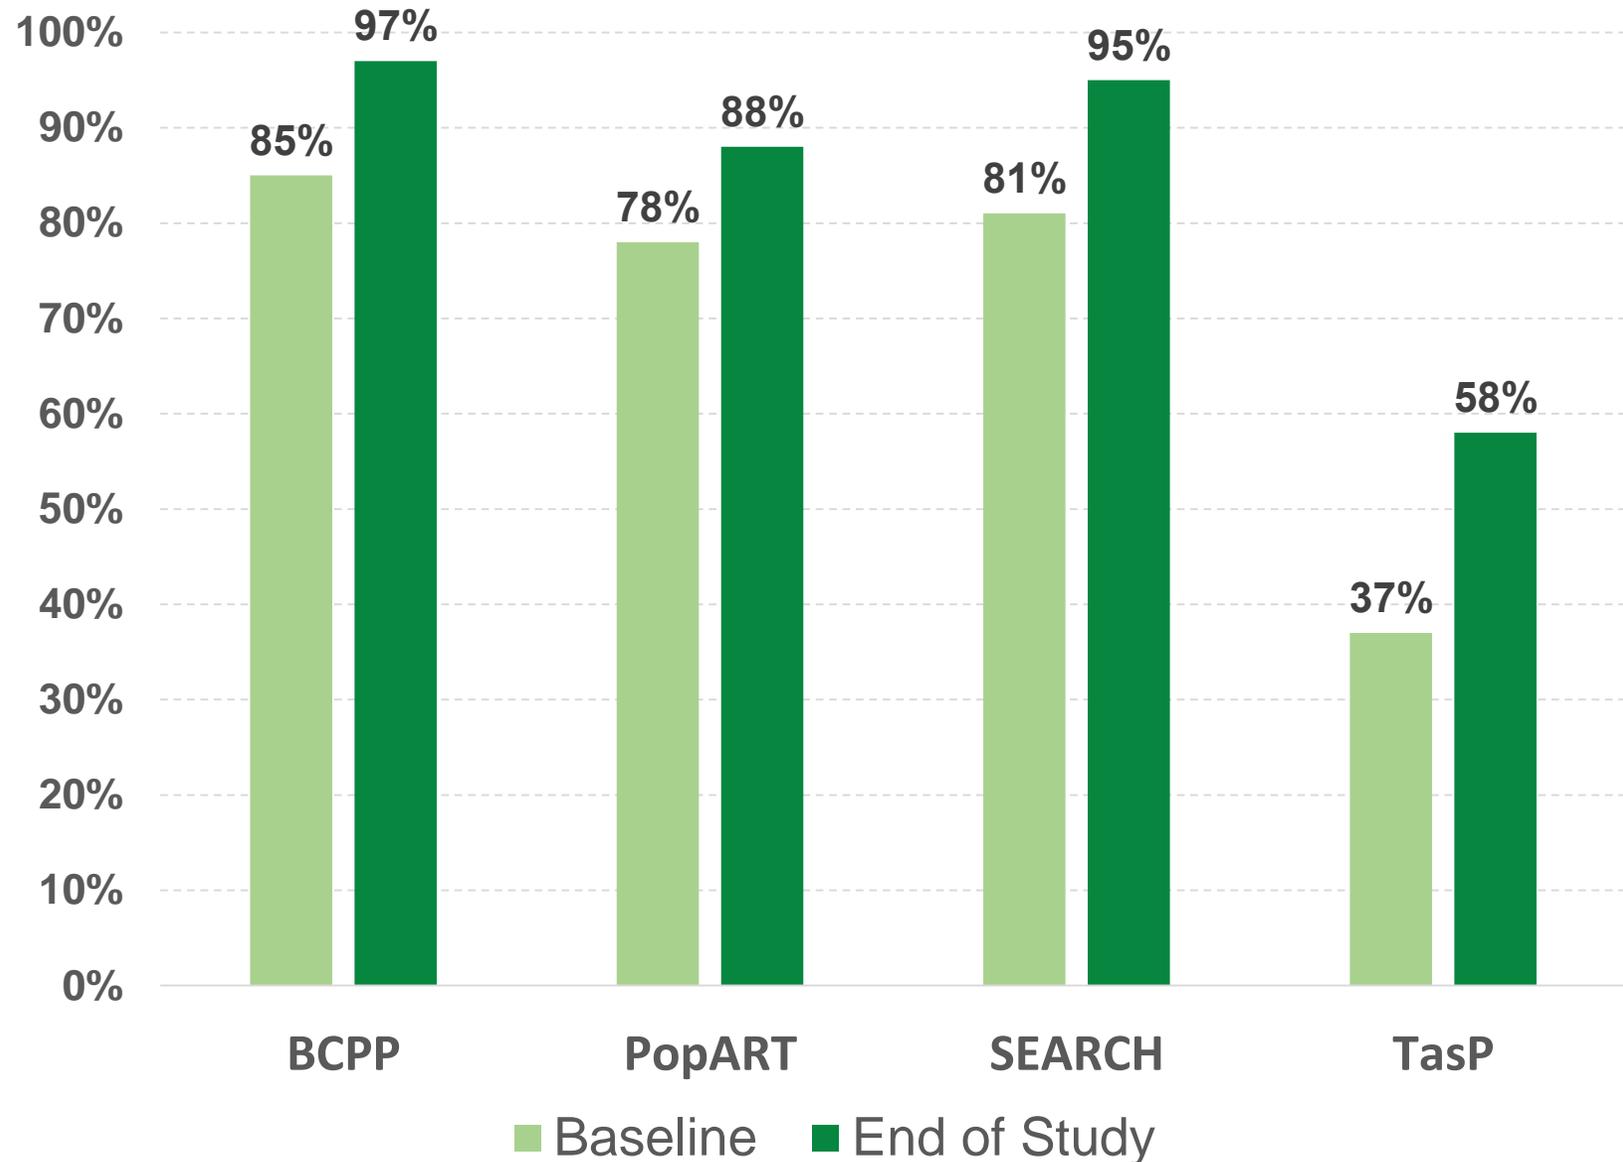

UNCLASSIFIED

\*Intervention arms only.  
PopART Intervention arms combined

# With UTT, 3 studies started ART in ~90-97% (2<sup>nd</sup> 90)

- › Rapid linkage and much faster ART start in intervention arms
- › Low linkage in TasP, but ART initiation high once linked to clinics

## 2<sup>nd</sup> 90: On ART/HIV Diagnosed

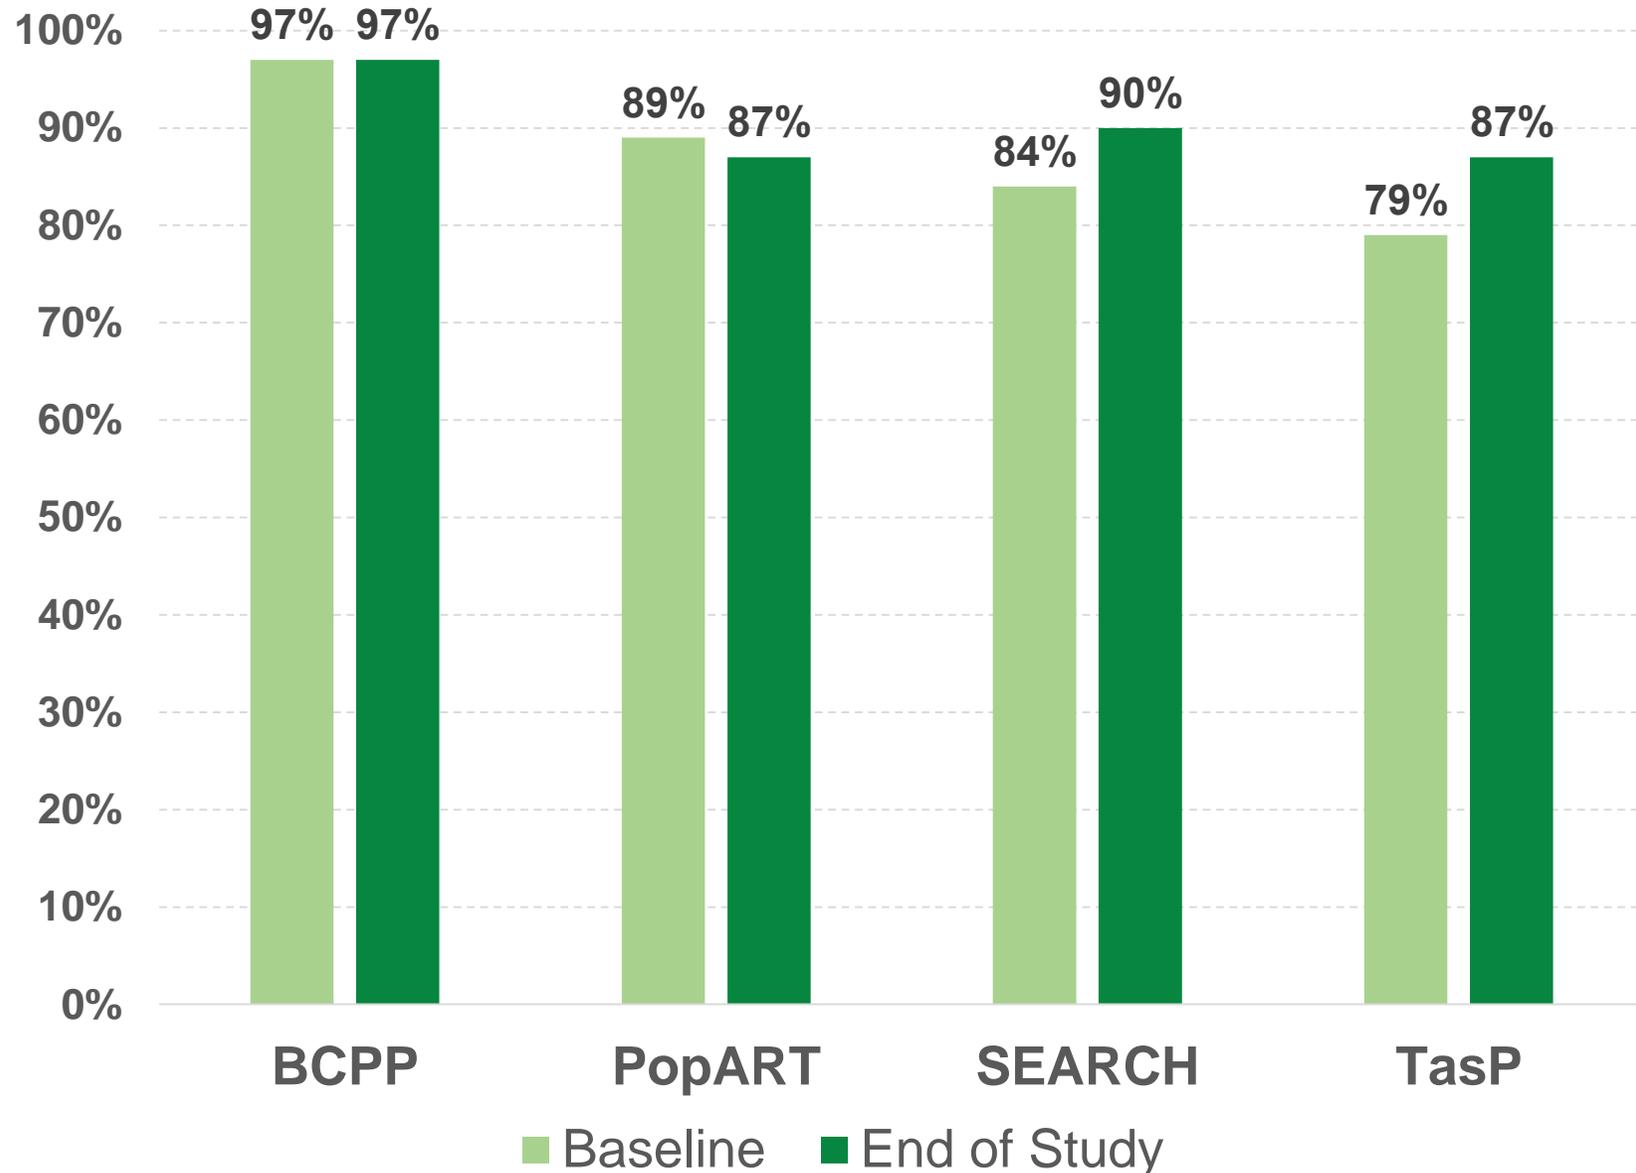

UNCLASSIFIED

\*Intervention arms only.  
PopART Intervention arms combined

**With UTT, all studies reached viral suppression ~90% if on ART (3<sup>rd</sup> 90)**

### 3<sup>rd</sup> 90: Virally suppressed/on ART

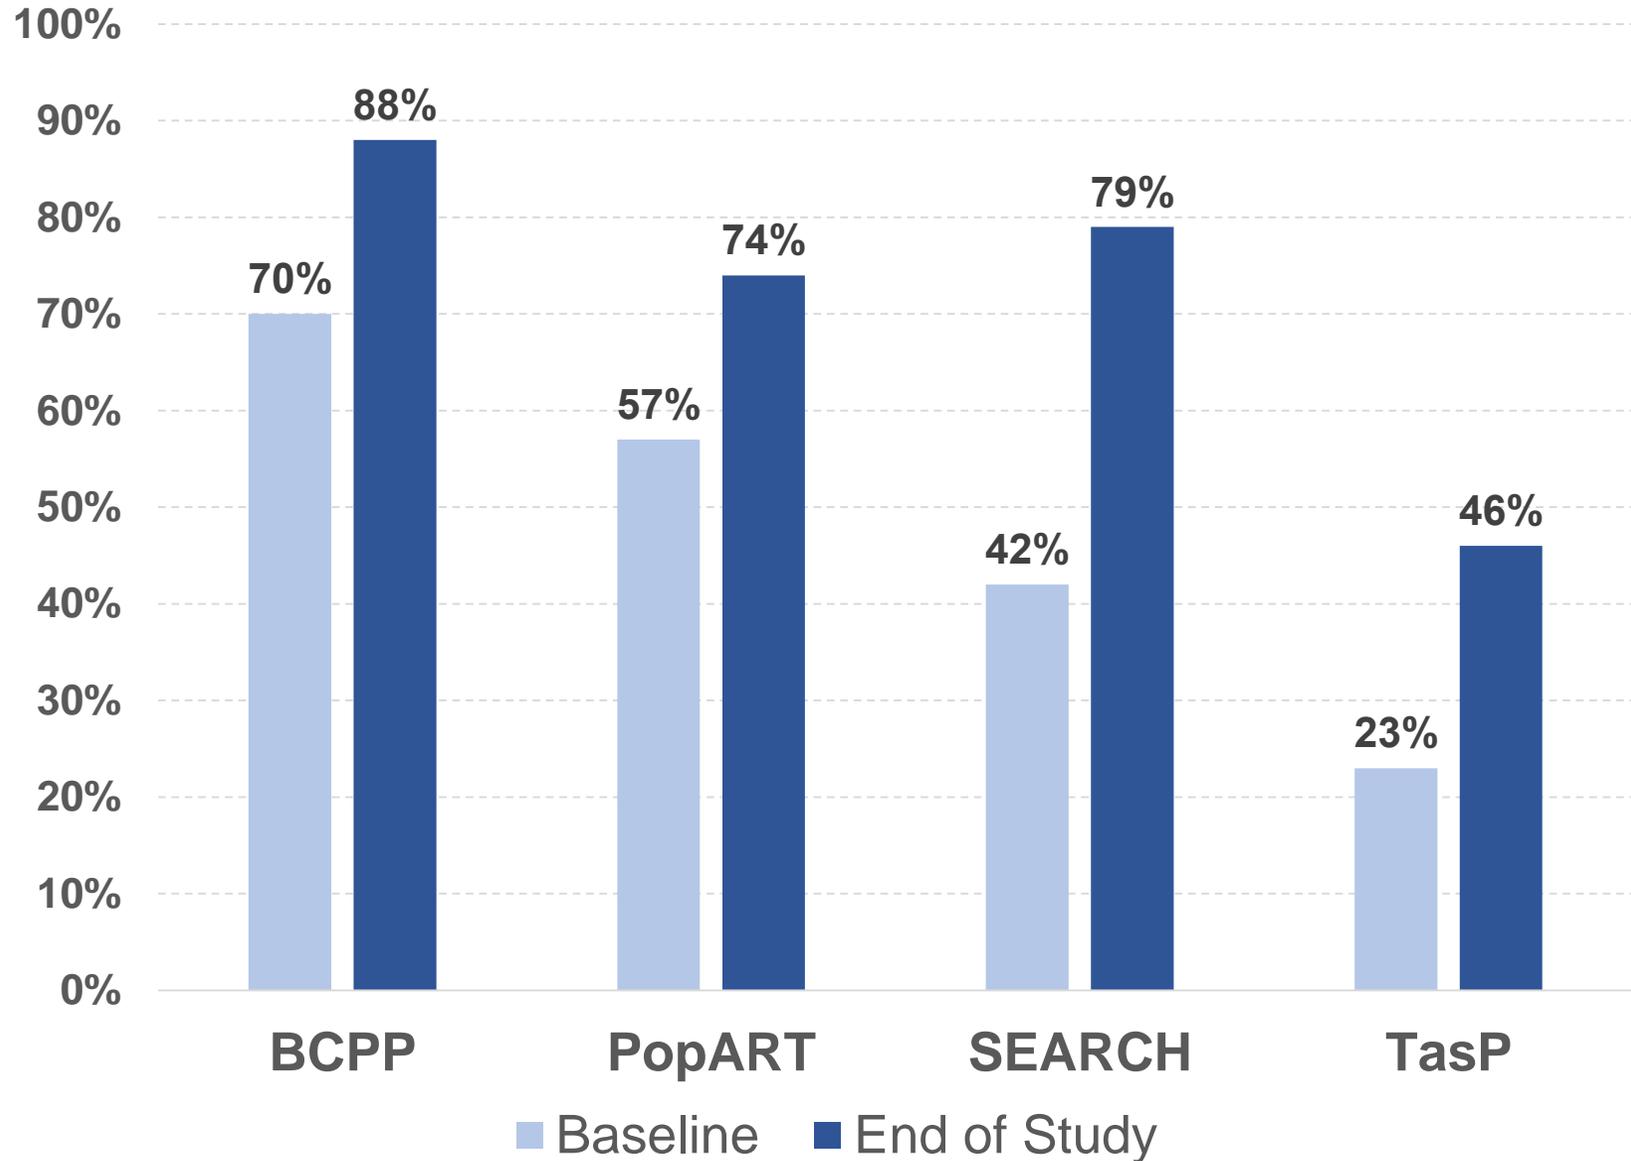

UNCLASSIFIED

\*Intervention arms only.  
PopART Intervention arms combined

# With UTT, 3 studies reached Population-level viral suppression >73%

- › Dramatic increases in population viral suppression over short period of time
- › From low (23%) or high (70%) starting point

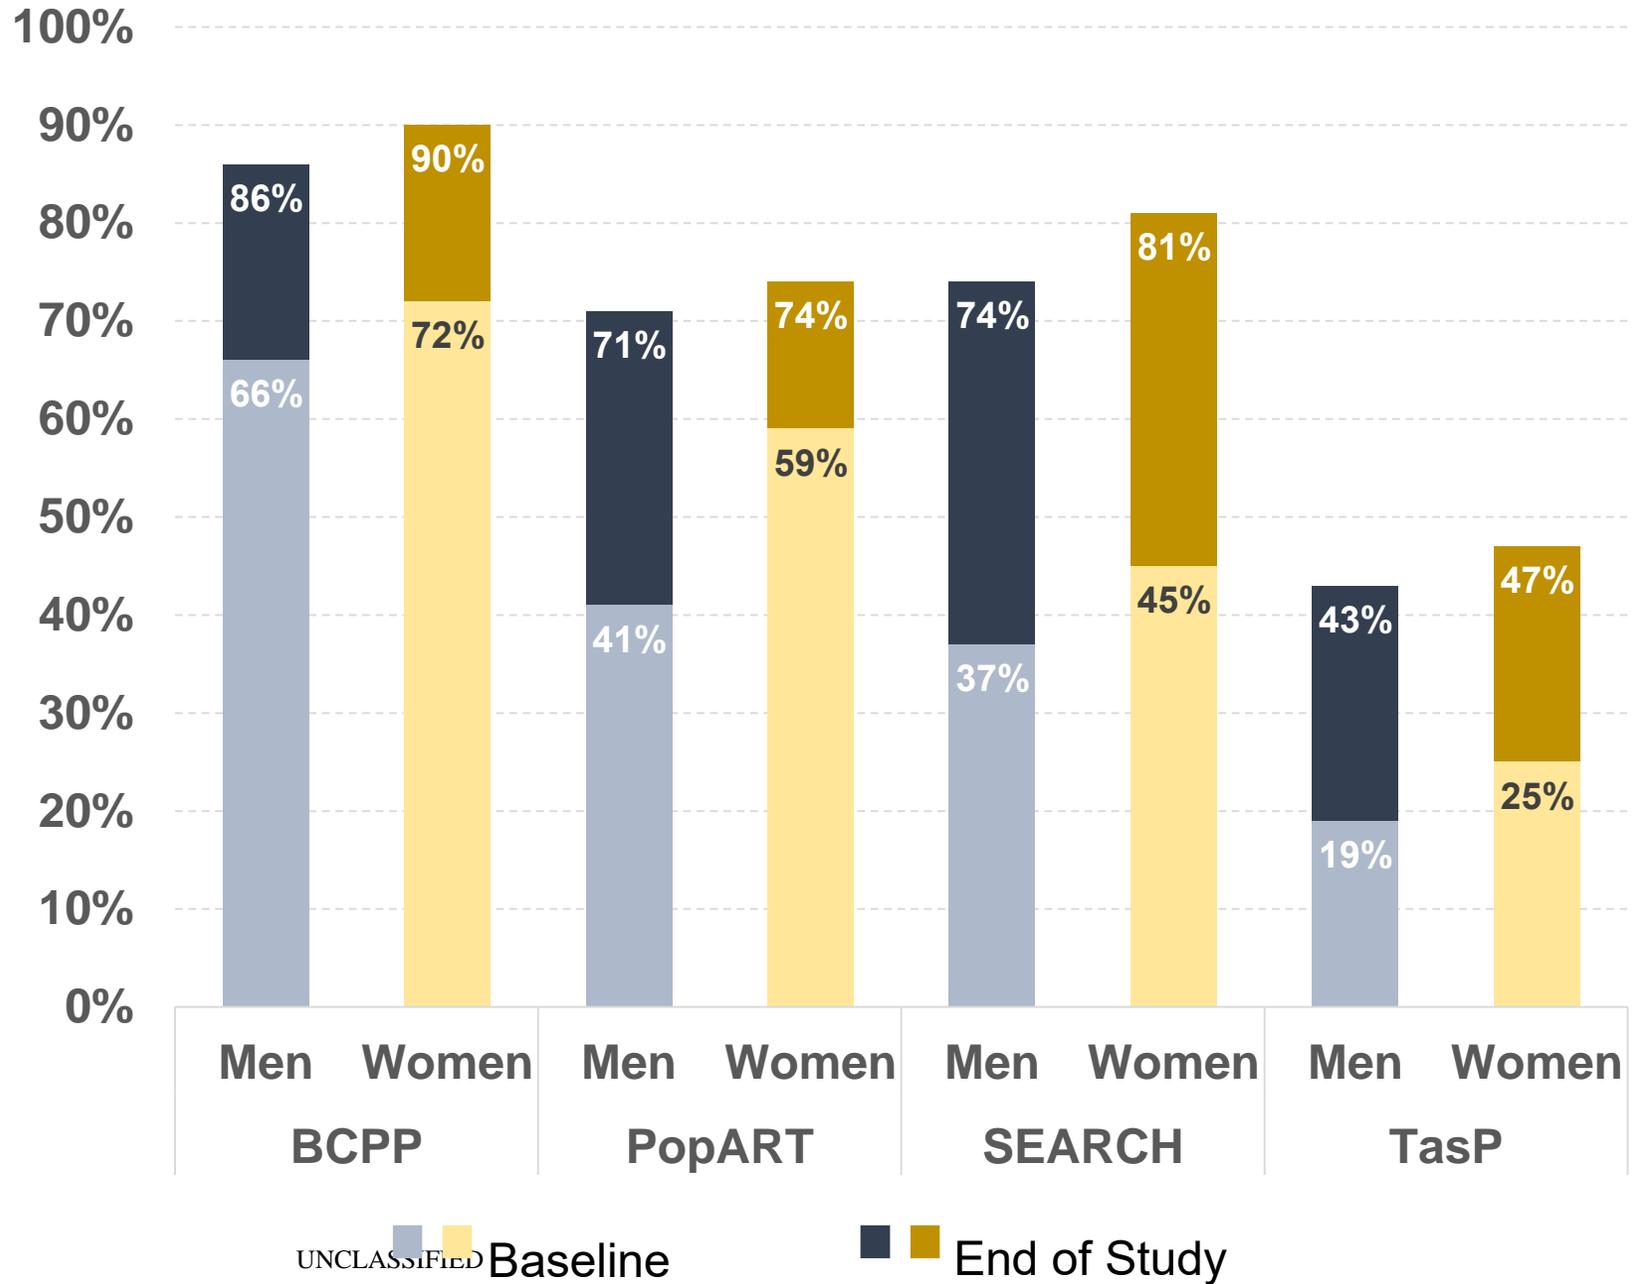

## Population-Level Viral Suppression

\*Intervention arms only.  
PopART Intervention arms combined

Interventions effectively increased population level suppression in both men and women

## Population-Level Viral Suppression by Sex

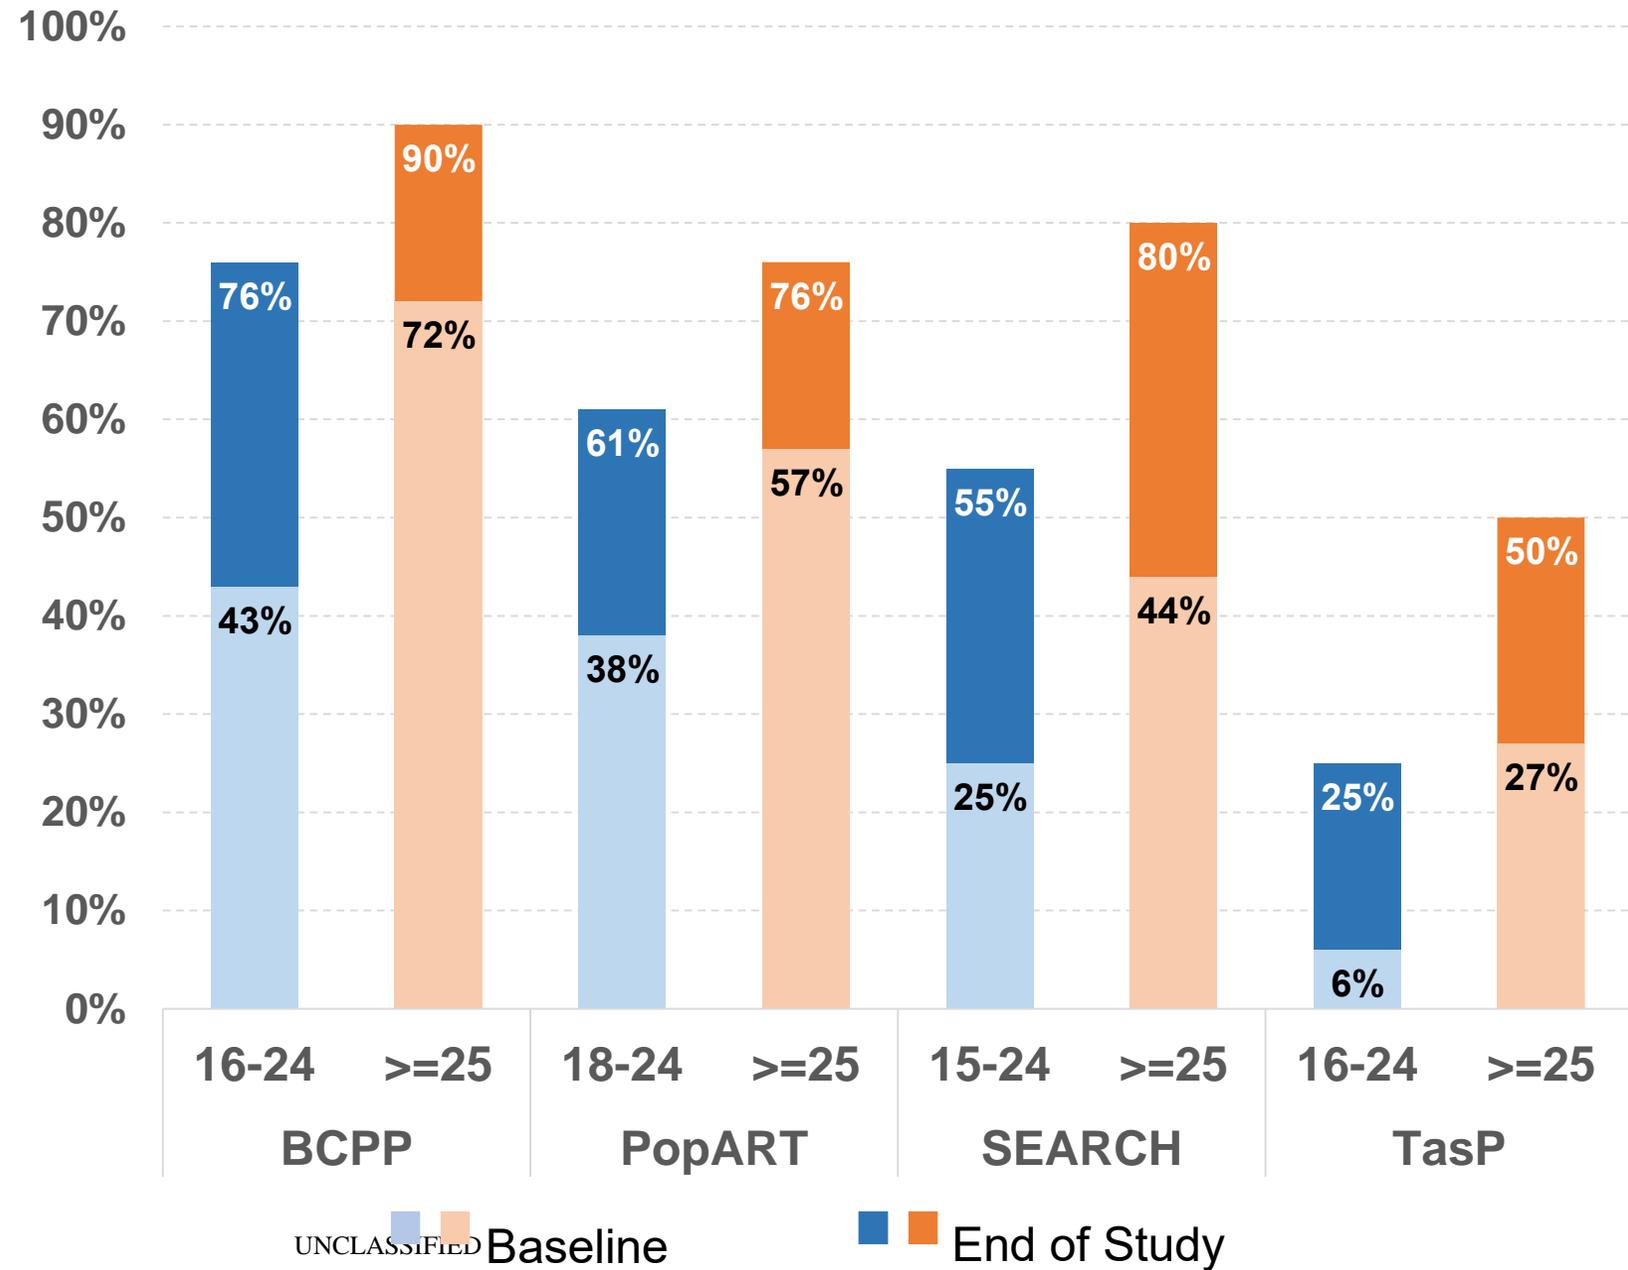

\*Intervention arms only.  
PopART Intervention arms combined

# Interventions showed variable gains in youth

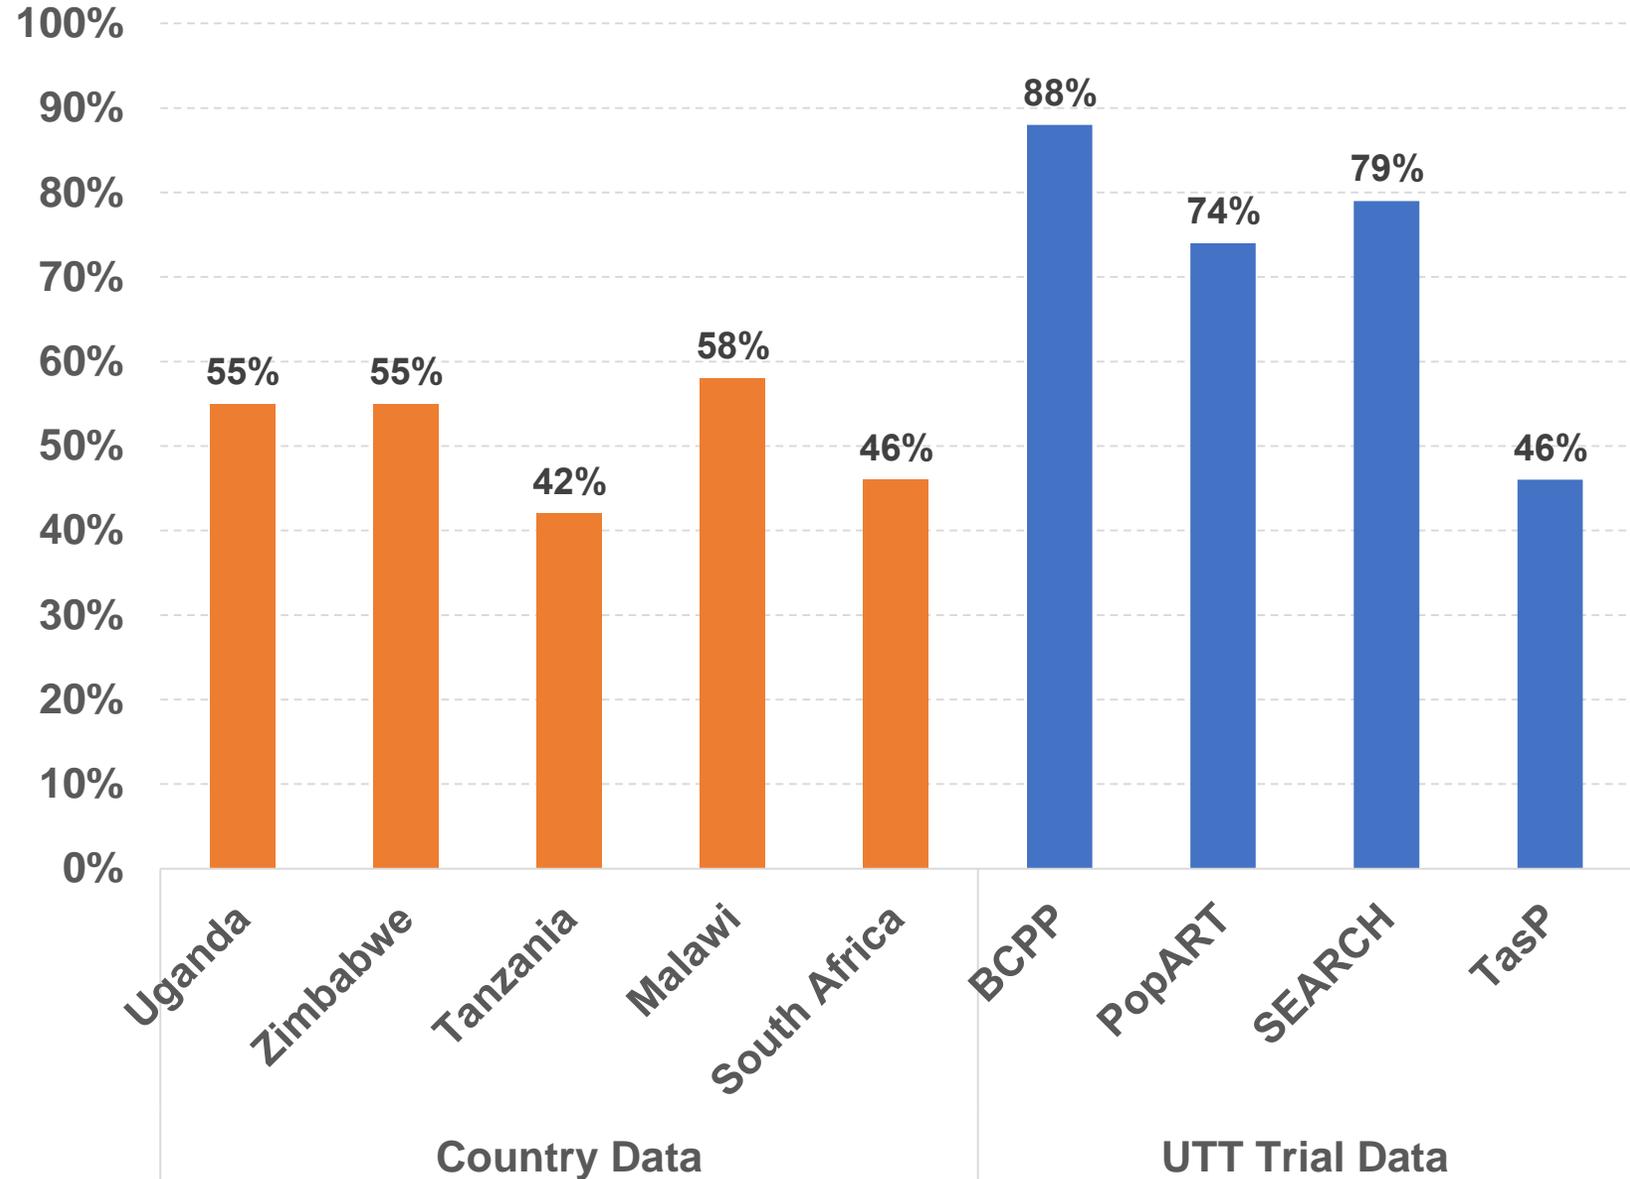

- › Suppression among youth still remains low in all studies
- › Contributions from new infections and worse ART uptake and outcomes

## Population-Level Viral Suppression: Youth

\*Intervention arms only.  
PopART Intervention arms combined

# Population-Level Viral Suppression

**UTT Population-Level Viral Suppression Exceeds Current “Standard of Care” in most African Countries**

Country VS Ref: El-Sadr, NEJM, 2019, and UNAIDS Report

# Summary: Universal testing and treatment is feasible

- 1. UTT rapidly increased population-level viral suppression levels exceeding most SSA country level estimates**
  - › Across a spectrum of HIV prevalence, baseline viral suppression
  - › Using different approaches, but with key commonalities
- 2. Universal testing both re-engaged prior HIV+s to care and identified new HIV infections**
  - › Robust linkage and rapid ART start interventions increased viral suppression
- 3. Achieved substantial increases in suppression among men and youth**
  - › Disparities in some cases reduced, but not eliminated

**Did implementation of UTT reduce HIV incidence?**

# HIV Incidence findings

- › Population-level outcome
- › Reflect very short time frame of these trials (~3 years)

- 1. HIV incidence effect (~20-30% reduction) observed when UTT compared to a control *without* universal testing (BCPP & PopART)**
- 2. HIV incidence reduced (~30%) in *both arms* when control arm had universal testing (SEARCH)**
  - › 32% reduction observed between years 1 and 3 (SEARCH intervention arm)

**Note: Impact of UTT intervention in trials setting (vs national-scale up) was almost certainly underestimated, due to mixing outside of intervention communities**

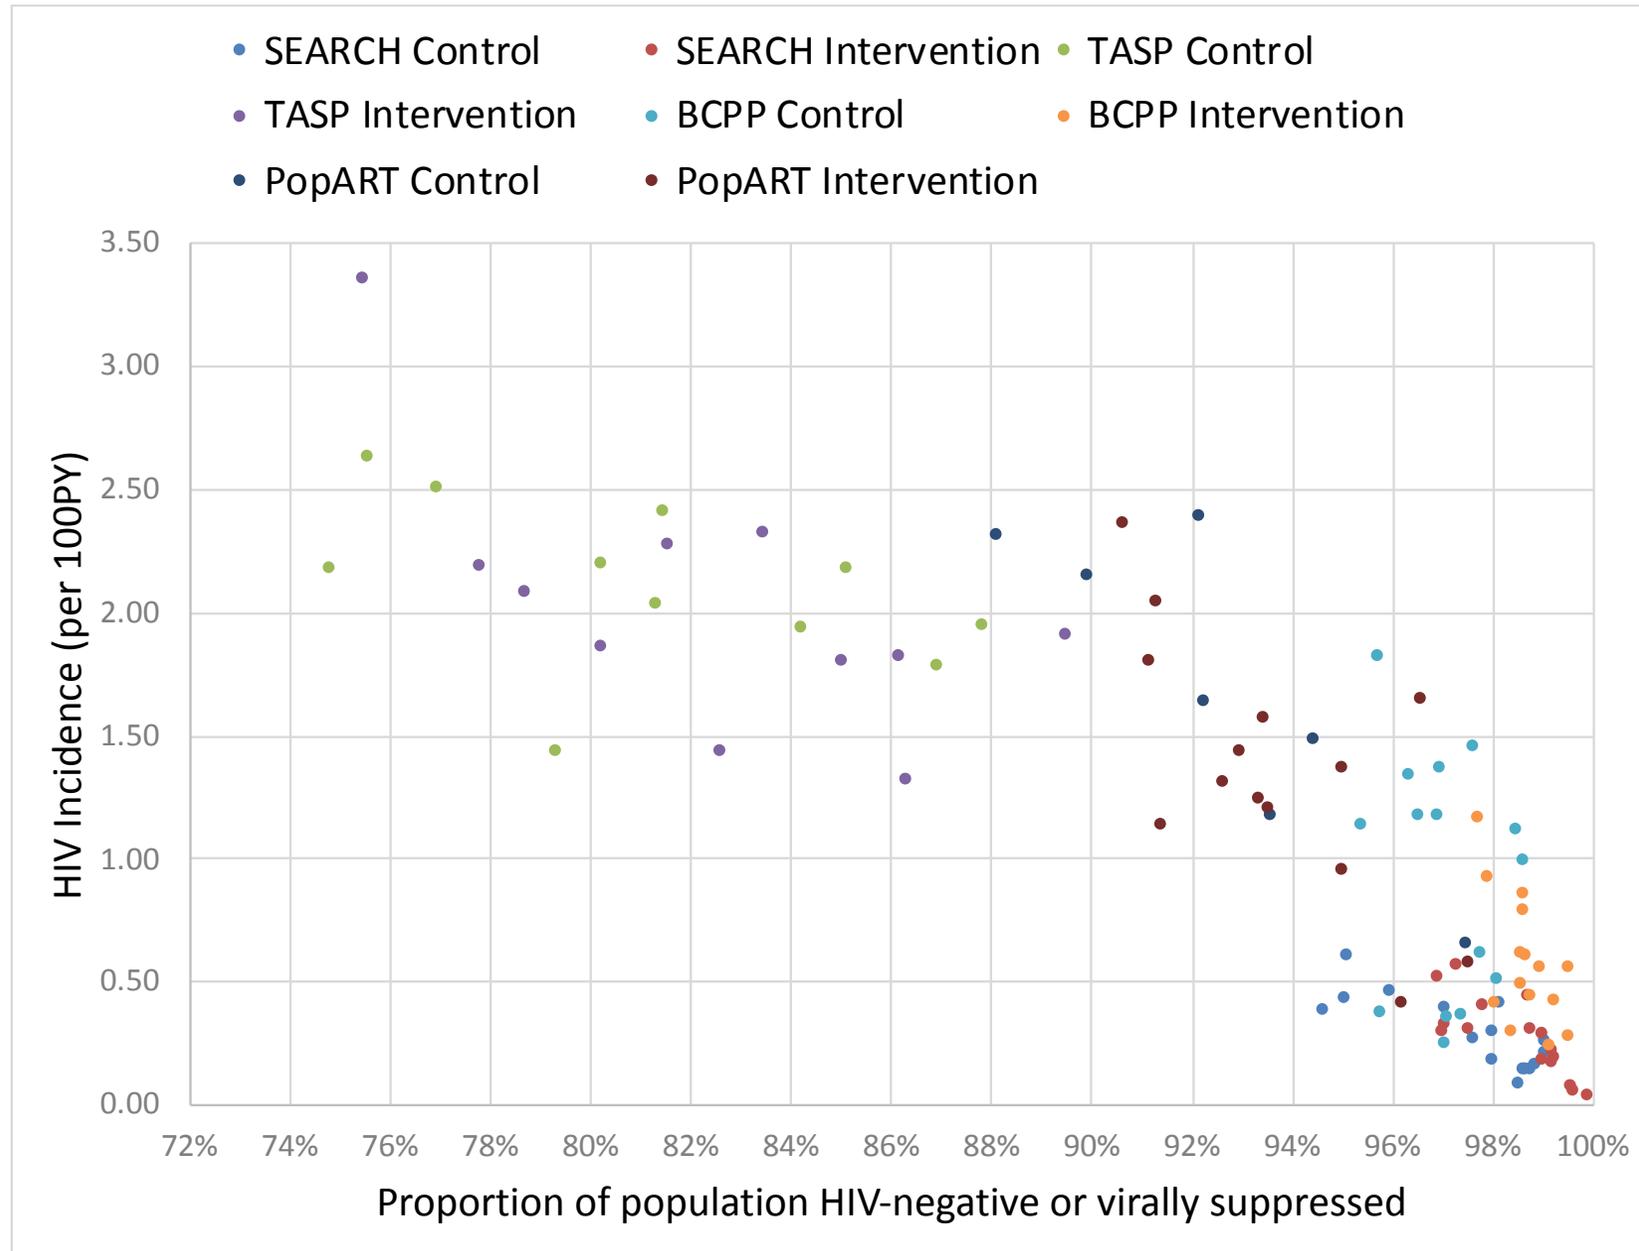

# HIV incidence outcomes

Trial	BCPP		PopART		SEARCH		TasP	
Country	Botswana		South Africa / Zambia		Kenya / Uganda		South Africa	
Arm	C	I	C	I	C	I	C	I
Universal testing	-	✓	-	✓	✓	✓	✓	✓
Universal treatment	-	✓	-/✓	-/✓	-/✓	✓	-	✓
Population viral suppression								
- at start	75%	70%	52%	57%	42%	42%	26%	24%
- at end	83%	88%	68%	74%	68%	79%	45%	46%
- difference	+8	+18	+16	+17	+26	+37	+19	+23
HIV incidence								
<i>Annual incidence for 100 person-years</i>	0.92	0.59	1.55	1.24	0.27	0.25	2.27	2.11
<i>Reduction (I vs C)</i>	31% reduction		20% reduction		not significant, but 32% reduction in intervention arm between years 1 & 3		not significant	

**Note:**  
both intervention arms  
were pooled for PopART.

# Population viremia correlated with incidence

- › Fewer people with viremia associated with fewer transmissions
- › Seen across all studies
- › Heterogeneity as expected
  - › mobility, external infections, network structure

UTT consortium, confidential, unpublished, not for distribution

UNCLASSIFIED

# Should we do UTT? the investment case

## YES

Solid evidence that UTT can rapidly achieve high levels of viral suppression and reduce HIV incidence faster than standard of care

- › UTT may also be the most effective way to rapidly reduce mortality
- › Universal Testing is a gateway for prevention (e.g. PrEP)
- › UTT costs could be shared using multi-disease approach and improve outcomes of other diseases

## NO

UTT cannot and will never lead to HIV elimination

- › Universal Testing is too costly
- › Need for universal testing in current landscape (PrEP) has not been directly quantified
- › Targeted testing of high-risk persons is sufficient (including partner notification)
